1. INTRODUCTION

Cobide Engineering Inc. was retained by Wilson Developments to provide engineering services in support of a Site Plan Approval Application for Phase 1 of their proposed industrial development in the village of Dundalk.

A copy of the proposed Site Plan has been included in Appendix A as Drawing SP1.

1.1 LOCATION

The proposed development is located Part of Lots 235 and 236, Former Township of Proton, Township of Southgate, County of Grey (described herein as the “site”). A Site Location Map is included as Figure 1. The subject property is approximately 4.85 hectares in area.

1.2 DEVELOPMENT PROPOSAL

The proposed development be completed in phases with Phase 1 consisting two (2) 1,113.6 m² rental unit buildings, adjacent parking areas and an interior roadway. Phase 2 will consist of constructing a 9,300 m² industrial building. The total area to be developed is approximately 4.85 hectares.

There will be a private road throughout the site providing access around the buildings. One entrance will be provided in the southwest corner of the property off Eco Parkway.

The Site Plan showing the overall configuration of the development has been included in Appendix A and noted as SP1.

The subject property is currently designated Industrial in the Township of Southgate’s Official Plan and is zoned “M1 – General Industrial Zone” in the Township of Southgate’s Zoning By-law. The subject property is within the Dundalk Settlement Boundary of the current Official Plan of the Township of Southgate and thus is intended for servicing from municipal water and municipal sewage.

The servicing of Phase 2 will be dealt with under a separate approval.

1

Title

REGIONAL LOCATION MAP

2. WATER DISTRIBUTION SYSTEM

The water distribution system will be sized based on the existing conditions at the connection to the municipal system and the proposed development's estimated demands which are determined by the Ministry of the Environment, Conservation and Parks (MECP) Design Guidelines for Drinking-Water Systems (2008).

2.1 DESIGN CRITERIA

The water distribution system will be design in accordance MOE guidelines which state the system "should be designed to satisfy the greater of the following demands:

- *Maximum day demand plus fire flow; or,*
- *Peak hour demand*

The maximum day demand and peak hour demand are based on the projected water consumption from the development and the fire flow is based on the type of the development.

The system will require modelling during the detailed design stage to ensure the water pressure throughout the system is within the requirements of the MECP.

Based on MECP guidelines, the minimum pressure at ground level at all points in the distribution system under maximum day demand plus fire flow conditions are to be 140 kPa (20 psi). The normal operation pressure should be between 350 kPa (50 psi) to 480 kPa (70 psi). There shall be no point in the distribution system that has a normal operating pressure of less than 275 kPa (40 psi). The maximum pressure in the pipe cannot exceed 700 kPa (100 psi).

2.2 WATER CONSUMPTION

The system will be designed based on the average recommended commercial water demand of 5 L/m² of floor area/day per the MECP's Design Guidelines for Drinking-Water Systems (2008).

Table 1 below summarizes the projected water demands for the proposed development.

Table 1 - Proposed Water Demands

Demand	Area	Consumption	Peaking Factor	Peak Rate (L/day)	Peak Rate (L/s)
Rental	2,227 m ²	5 L/m ² /day	2.5	27,838	0.32

The system should be capable of supplying a minimum of 0.32 L/s of water to meet the peak hour demand of the proposed development.

2.3 WATERMAIN CONFIGURATION

A 150mm diameter watermain will be connected to the municipal system at the proposed entrance into the development. There is currently a 150mm diameter watermain on the east side of Eco Parkway.

A single 50mm diameter connection will be provided to each storage building.

A drawing showing the proposed watermain distribution network has been included in Appendix A.

3. SANITARY SEWER SYSTEM

The sanitary servicing of the proposed development will be sized based on the existing conditions at the connection to the municipal sanitary sewer and the proposed development's estimated site demands which are determined by the MECP *Design Guidelines for Sewage Works (2008)*.

3.1 DESIGN CRITERIA

The sanitary sewer system will be designed in accordance MECP guidelines.

The sanitary sewer will be designed to convey the projected peak flow based on the site's occupancy load as well as extraneous flows.

3.2 DESIGN FLOW RATES

The sanitary sewer will be design flows are expected to be similar to the water usage. Therefore the peak flows are expected to be approximately 0.32 l/s.

3.3 SANITARY SEWER CONFIGURATION

There will be a sanitary sewer through the middle of the site with a single connection to the existing sanitary sewer. Based on the as built drawings received for the area, there are sanitary sewers north of the site which connect to the sanitary sewer system on Eco Parkway that will provide the outlet for the development.

All sanitary sewers are proposed to be 200mm diameter PVC pipe. The minimum slope considered will be 0.40% to maintain a minimum velocity at full flow to prevent sediment deposition and blockages.

A drawing showing the proposed sanitary collection network has been included in Appendix A as Drawing 03710-SS1.

4. STORM SEWER SYSTEM

The subject property is currently vacant. The site is generally sloping from south to north, and west to east. There are no existing storm sewers on the property. The site mainly discharges into an existing ditch on the west side of Eco Parkway. Eco Parkway will be considered Discharge Point #1 for the purposes of this report.

The proposed development will be graded such that runoff is conveyed via storm sewer system and sheet flow to a new wet stormwater management pond in the northeast corner of the property. The outlet for the stormwater management pond will consist of a headwall, and a 300mm dia. storm sewer c/w an orifice, that will then discharge into the existing ditch on the west side of Eco Parkway.

The storm sewer system will be designed in accordance with the municipal and conservation authority guidelines including the Ministry of the Environment, Conservation and Parks (MECP) Design Guidelines. The storm sewer system will use the rationale method to size the storm sewer to accommodate the 5 year peak flow from the development. The majority of the site will discharge to the proposed storm sewers.

The hydrologic modelling software PCSWMM Version 7.4.3240 Professional 2D was used to determine the pre and post-development peak flows of the 5 yr., 25 yr., and 100 yr. storm events (3 hour Chicago Storm Event, Dundalk IDF Parameters using MTO Curve Look-Up Tool).

The pre-development and post-development parameters and model outputs are contained in Appendix B.

For the purposes of this report, Discharge Point #1 will be the Eco-Park Way Ditch and Discharge Point #2 will be the lands to the north of the property.

4.1 DESIGN REQUIREMENTS

The intent of stormwater quantity control is to limit the flows under proposed conditions to existing levels or less to protect the downstream watercourses, infrastructure and properties.

Minor and Major flows from the majority of the development will be conveyed to the proposed stormwater management facility via a new storm sewer system throughout the site and overland flow routes.

Due to the increase in impervious area, stormwater quantity control will be required for the site. The design of the stormwater management facility has assumed a free outlet from the pond.

4.2 SWM FACILITY CHARACTERISTICS

The stormwater management facility and outlet structure have been designed to control peak runoff rates as well as conform to MECP best practices.

In order to provide the above required volumes and discharges, the following SWM Facility geometry is being proposed:

Table 4.1 – SWM Facility Geometry

SWM FACILITY	DETAILED DESIGN
Side Slope	3:1 - 5:1
SWM Facility Bottom	508.00 m
Permanent Pool Elevation	509.00 m
Top Elevation	510.25 m
High Water Elevation	509.57 m

The outlet configuration for the SWM Facility will be as follows:

- A 300mm diameter storm sewer with a 175mm orifice and an outlet elevation of 509.00 m;
- The outlet pipe will discharge into the roadside ditch on the west side of Eco Parkway

As seen by the proposed inverts, the proposed stormwater management facility will be constructed as a wet pond.

4.2.1 SWM FACILITY PERFORMANCE

Below is a summary of the hydraulic performance of the stormwater SWM Facility during the various storm events.

Table 4.2 – SWM Facility Performance

RETURN PERIOD	ELEVATION (m)	STORAGE (m³)	DISCHARGE (l/s)
5 Year	509.35	1,448	35.3
25 Year	509.47	2,049	43.1
100 Year	509.57	2,542	48.3

4.3 MODELLING RESULTS

Based upon the above outlet structure, the following summarizes the pre-development and post development peak flows to the discharge point.

Table 4.3 - Peak Flow Summary

RETURN PERIOD	DISCHARGE POINT #1 (L/S)		DISCHARGE POINT #2 (L/S)	
	PRE	POST	PRE	POST
	5 Year	43.3	35.3	15.3
25 Year	92.9	43.1	32.4	0
100 Year	147.8	48.3	51.2	0

As seen in the above table, the post development peak flows will be less than the pre development peak flows for all design storm events at Discharge Point #1. The peak flow is being conservatively controlled by the proposed stormwater management pond.

4.4 WATER QUALITY

The MOE guidelines require that extended detention SWM facility's provide quality treatment of 40m³/ha and discharge it over a minimum of 24 hours. Having an extended detention component in the quality ponds provides settlement of suspended solids.

The following table summarizes the volume requirements based the MOE Guidelines.

Table 4.4 - Water Quality Requirements

POST DEV DRAINAGE AREA (ha)	MOE VOLUME REQUIREMENT FOR NORMAL PROTECTION BASED ON 81.5% IMPERVIOUS (245 m ³ /ha)	MOE EXTENDED DETENTION (40 m ³ /ha)	PERMANENT POOL REQUIRED (m ³)
4.48 ha	1,120 m ³	180 m ³	940 m ³

The wetland facility will provide 6,250 m³ of active storage volume. The pond will provide a permanent pool volume of 2,800 m³. The pond has sufficient volume and size to meet water quality sizing requirements.

5. GRADING & EROSION AND SEDIMENT CONTROL

Erosion and sediment controls shall meet the requirements of the most recent version of the MECFP *Stormwater Management Planning and Design Manual* at the time of construction.

5.1 CONSTRUCTION STAGE

Prior to the start of construction, appropriate sediment control facilities are to be in place. Following are details regarding erosion and sediment control that are to be implemented:

- Placement of heavy duty siltation fencing is required to be installed around the property boundary within the drainage corridor on the north and east side of the site to intercept sediment that could potentially be transported by sheet flow across the site. Light duty siltation fence will also be installed at any development grading limits where runoff may discharge from the site.
- It is proposed that the stormwater management pond be constructed first to act as a sedimentation basin.
- Placement of temporary straw check dams within the Eco Parkway drainage ditch downstream of the site;
- Installation of filter cloth under all new catchbasin grates until paving of the roadway is completed;
- Mud mats will be placed at construction access to keep public roadways free from debris during the construction period.
- Re-vegetate all disturbed areas after underground and surface works have been constructed.

Prior to removal of sediment control facilities, ensure that sediment that may have accumulated has been removed.

Once the area has been stabilized, the silt fencing can be removed.

Sincerely,

Cobide Engineering Inc.

Travis Burnside, P. Eng.
